

Useful frames do not simply add up

A frame can help alone, yet change value when combined—so ranking frames independently can miss the best set.

1. Evidence is useful

17 / 18

settings

Individual evidence frames
outperform outside frames.

2. But frames interact

18 / 18

settings

The value of a frame changes
depending on what it is paired with.

3. So independent ranking fails

Measured singleton ranking

+ measured pair interactions

Mean regret drops

-58%

when accounting for pairwise interactions.
